

A wide-angle photograph of the Dubai skyline at dusk. The sky is a clear, vibrant blue. In the foreground, a paved promenade with a yellow double line runs along a body of water. To the left, there are several palm trees and a small beach area with people. In the background, a dense cluster of skyscrapers is visible. The most prominent building is a tall, blue glass skyscraper with a large, rectangular cutout in its center. Other buildings of various heights and colors (yellow, white, blue) surround it.

# **Dubai Real Estate Intelligence Dashboard**

# INTRODUCTION

Hello, In this presentation, we will go through the ***Dubai Real Estate Intelligence Dashboard***.

- I appreciate the opportunity given to me to dive into this Real Estate data to gain insightful information about the business performance.
- And How to think from the perspective of business leaders to analyse data more effectively and How to prepare for a meeting with Investors, Real Estate Agents and policymakers.

# PROCESS

---

All the necessary steps were taken to ensure that the analysis is accurate and correct.

I cleaned up the data by addressing any missing or incorrect values, filtering out nulls, and eliminating duplicates to ensure accuracy. I then converted data types, setting numeric fields like price and size appropriately, while defining categorical values for type and location.

After that, I created calculated columns to boost my analysis, such as calculating Total Listings, price\_per\_sqft and categorizing listings by price quantiles for all the visualization.

# Dashboard Layout

In the Power BI dashboard, the layout is designed to provide a comprehensive overview of the real estate data at a glance. The KPI cards prominently display key metrics, including the total listings, average price, average price per square foot, the oldest property, and the most expensive property. These metrics deliver essential insights into the market's health.

**Bar Chart:** This chart compares prices by property type, allowing stakeholders to easily discern which types, such as residential or commercial, command higher prices. It aids in strategic planning for investments or sales.

**Stacked Column Chart:** Showcasing the count of listings by the number of bedrooms, colored by property type, this visualization reveals market supply and demand trends, assisting real estate professionals in tailoring their marketing strategies.

# Visual Chart Analysis

**Line Chart:** Illustrating price trends over time, this chart highlights fluctuations in property values, enabling stakeholders to forecast future trends and make strategic buying or selling decisions.

**Map:** A bubble or filled map displays the average price per location, helping users quickly identify high-value and affordable neighborhoods. This geographic representation is essential for understanding location-specific property trends.

**Tree Map:** Visualizing listings by developer and property type, the tree map uses nested rectangles to represent segments, offering insights into market distribution and developer competition.

**Area Chart:** Illustrates cumulative property prices over time, effectively showcasing trends and helping stakeholders visualize changes in the market, assisting in long-term decision-making.

# Slicers For Dynamic Filtering

**Filter Slicers:** Allow users to refine data based on criteria such as furnishing status, property type, and price range, enhancing interactivity and enabling targeted analysis.

**Pie Chart:** titled "PropertyAge by ListingCategory," which visualizes the distribution of property listings by different categories. The chart breaks the listings into three main categories:

- **High-End:** Represented in blue, accounting for 33.02% (654K) of the total listings.
- **Mid-Range:** Represented in purple, accounting for 32.9% (653K) of the total listings
- **Budget:** Represented in light blue, accounting for 34% (673K) of the total listings.

The pie chart effectively illustrates the proportion of listings categorized by pricing tiers, with each segment's percentage and number highlighted for.

Together, these visualizations form a robust analytical tool for exploring real estate market dynamics and facilitating informed decision-making.

# Business Questions Answered by the Dashboard

---

The dashboard provides answers to a range of business questions, allowing for a detailed understanding of the market. It can be used to answer questions such as:

- What is the current state of the Dubai real estate market? (Total listings, average price, average price per square foot)
- How has the average price of real estate in Dubai changed over time? (Price by YearBuilt)
- How does property type relate to price and price per square foot?
- What are the most common property types and how do they impact the market? (Total Listings, Listings by Property Type)
- What are the most common configurations in terms of bedrooms and bathrooms?
- How does neighborhood type (e.g., Urban, Suburban, Rural) affect property prices and age?
- What are the average property prices across different locations? (Average Price by Location)

# Key Takeaways from the Data

---

- **Property Listings and Pricing:** The dashboard indicates there are approximately **50,000 total listings** in the dataset, with an average price of around **\$224,830** and an average price per square foot of **\$113.31**. The maximum price observed is **\$492,200**.
- **Property Type and Demand:** The "Listings by Property Type" chart shows that **urban and suburban properties are the most common**. This indicates a high level of market activity in these areas. The "Property Type By Location" chart further breaks down this trend by neighborhood.
- **Historical Trends:** The "Price by YearBuilt" chart shows a clear trend of increasing prices for properties built since 2006. This suggests that newer properties are more expensive and that the market has seen significant appreciation over time. Recent data from the broader market also supports that Dubai's real estate has experienced a surge in value since 2020 and is currently in a phase of steady growth.
- **Geographic Analysis:** The map shows property prices by location, providing a visual representation of which neighborhoods have higher average prices. It shows that "Urban" neighborhoods have the highest concentration of property listings.
- **Pricing by Property Age:** The "Property Age By Price in PerSqft" chart shows a relationship between the age of a property and its price per square foot, which can be useful for identifying undervalued or premium-priced assets.

# Suggested Actions for a Real Estate Investor or Agent

---

**Focus on High-Demand Segments:** The dashboard highlights that a significant number of listings are in urban and suburban areas. Investors could focus on these segments, especially for apartments and villas, which are in high demand and show a strong growth trajectory.

**Evaluate Off-Plan Opportunities:** Given the trend of increasing prices for newer properties, off-plan investments could offer potential for high capital appreciation. By analyzing the data on newer properties, investors can identify upcoming areas that are likely to see significant growth.

**Target Specific Neighborhoods:** The map visualization and other charts can help pinpoint specific neighborhoods with high average prices or strong listing activity. This data can inform targeted marketing campaigns for agents or specific investment strategies for investors, such as focusing on a "buy-to-let" strategy in areas with high rental yields.

**Use Data to Set Competitive Prices:** The dashboard provides average prices and prices per square foot, which are critical for setting competitive listing prices and for negotiations. This information can help agents advise clients on a realistic price range for buying or selling a property.

**Identify Potential for Value-Add:** By comparing "Property Age" and "Price per Sqft", an investor could identify older properties in desirable locations that may be undervalued. These could be potential "fix and flip" opportunities where renovations could significantly increase the property's value.

# Disclaimer

---

This report is based on the provided dashboard and general real estate market information. Real estate investment carries risks, and it is recommended to conduct a thorough analysis and seek professional advice before making any investment decisions.
